

AKM Version 6.0

UPGRADE CAN ONLY BE PERFORMED FROM AKM 5.70 !!
If you are running older versions, you must upgrade to 5.70 before upgrading to 6.0

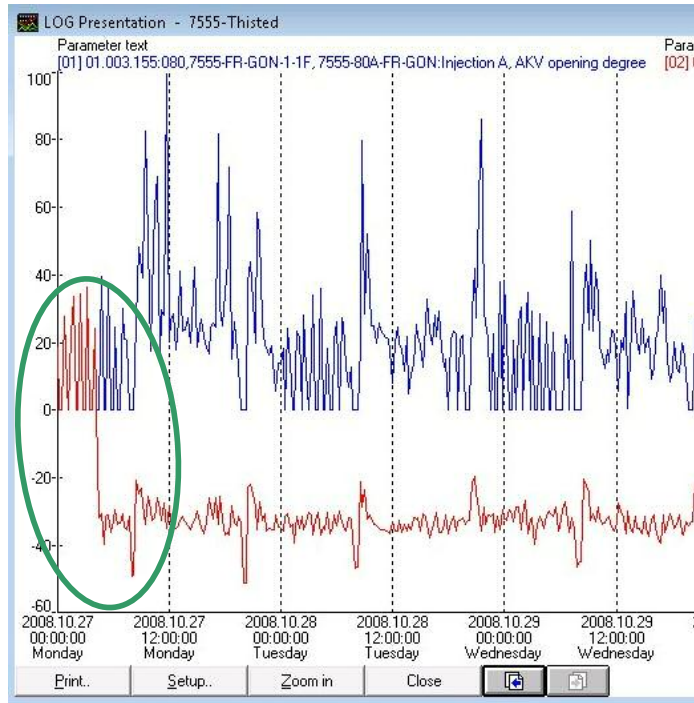

What's new: Data Migration Tool (From 5.70 to 6.0)
Windows Install wizard
SQL Database
Support for Windows Vista (32 bit only)

Note: Due to the database conversion, the upgrade from 5.70 to 6.0 will take a long time. Depending on the size of your databases, the installation of AKM 6.0 may take up to 16 hours or even more. The PC is not to be turned off or rebooted during this, even if it at times looks like there is no response from the program – Doing so WILL RESULT in loss of data. It is also advised that no other tasks are performed on the PC during the upgrade.

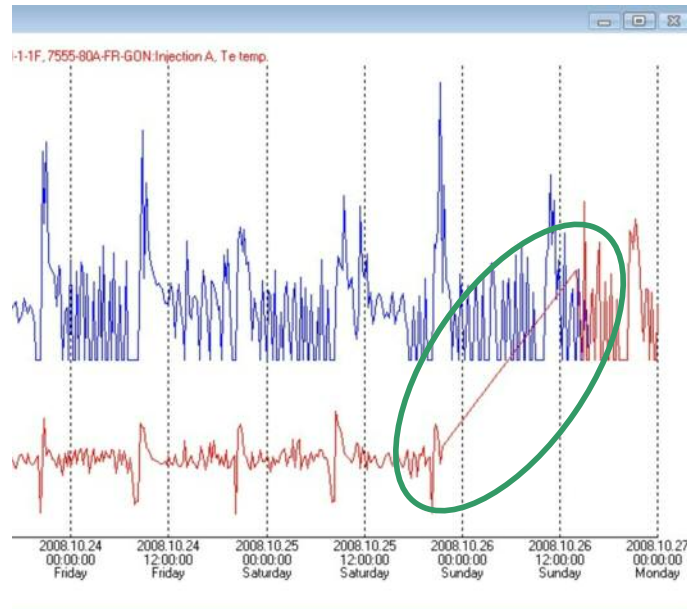

Known critical issues:

- An error may occur during the collection or saving of log data. The result is that log presentations may "jump"

Example 1

Example 2

- Auto log collection on AK1 systems, may not start right away.
- AK2 log collection error warning may occur.
- Export of data can take very long time. (Up to 6-7 times longer than normal)

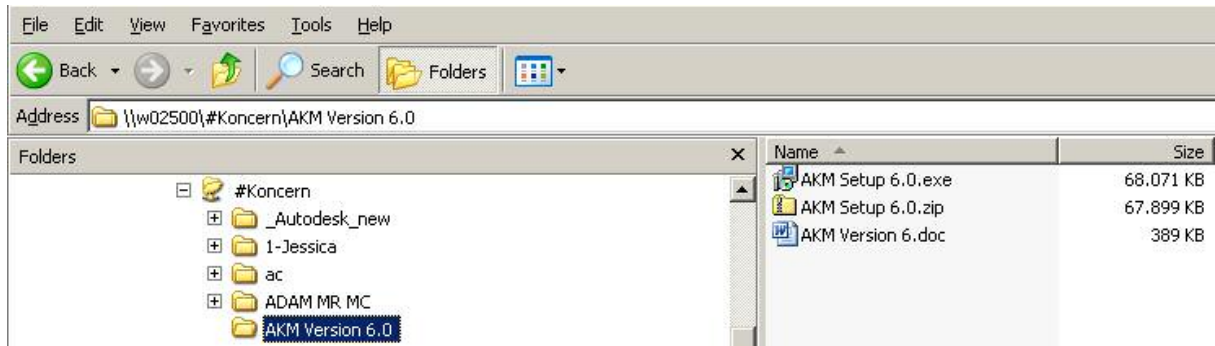

Common for these 4 critical issues is that they are inconsistent. We are able to reproduce the situations on some PC's, but not on others. For end users this means that some will never experience these errors, while others may do so, every now and then.

The nature of these errors makes it a very difficult task to debug and correct, but be assured that we are working very intensely to solve the problems as soon as possible.

AKM 6.0 file size:

Due to the growing size (>65Mb) it is no longer possible to upload AKM software to our ADAP-KOOL® Support site. This site has a file limit of 50Mb.

Most people have limit of 10-20Mb on their inboxes, so emailing the upgrades to customers may cause problems. Colleagues within our sales and support organisation can download the file from <\\w02500\#koncern\AKM Version 6.0> and keep it on their PC's to be able to make CD copies etc. for customers.
